

Diamond Lapping Compound

Diamond lapping compounds are manufactured from mixing of fine diamond powder in a liquid or oil base which is used for cutting action and longer operation life. To maintain a constant viscosity over a wide temperature range these are specially formulated. These properties make the paste an efficient tool in the very high precision industries where finish and cleanliness are utmost important.

By using this paste you will get incredibly brilliant finish on

- Ferrous and non ferrous metals,
- Watch cases,
- Wire drawing dies,
- Cemented carbide cutting tools.
- Calendar rolls
- Optical lenses
- Plastic injection moulds
- Tungsten carbide parts.
- Plug, Ring & thread gauges

Diamond lapping compound are available in two types.

- ☞ Water Soluble
- ☞ Oil Soluble

These come in different grades and color coding. Normally it comes in 5 cc Syringe.
